Test Report – Fire Resistance:

TESTING PERFORMED ON: A timber framed, stud wall with one layer of R2.5 x 90mm thk earthwool and sheeted with a single layer of 10mm thk SE FireCrunch board each side.

TEST DATE:	04/09/2018
REPORT WRITTEN BY:	M. Lewis
REPORT DATE:	12/09/2018
RTL REPORT NO:	TR-F025.01 (PR0057)
TEST ID:	FR33.S3/2018
SCOPE:	Measurement of fire resistance in general accordance with AS 1530.4-2014 Sections 1, 2 and 3

4. REPORT SUMMARY

Fire resistance test on a timber framed, stud wall with one layer of R2.5 x 90mm thk earthwool and sheeted with a single layer of 10mm thk SE FireCrunch board each side. The specimen under test achieved the following fire-resistance levels in general accordance with AS 1530.4-2014.

Test Results	
Structural adequacy	n/a
Integrity	62 minutes ¹
Insulation	62 minutes ¹
FRL	-/60/60

¹ No failure recorded

Post-Test Observation

At the request of the Client a subsequent cooldown and observation phase was carried out after the end of the 60-minute fire test. The Client nominated a modified AS 1530.8.2 Performance Criteria (ref: AS 1530.8.2-2007 C13.8), the modification namely being a 60-minute AS 1530.4 test followed by 60 minutes of observation.

With agreement of the Lab, 13.8 Performance Criteria (as modified above) (b), (c), (e) & (g) were monitored during the observation period.

The test was shutdown at 62 minutes and the sample was removed from the furnace without the thermocouples being disconnected from the logging equipment and was placed in a specimen frame cradle. The cradle and wall were positioned on an angle away from the furnace so as to not be affected by radiant heat from the furnace.

Over the subsequent observation period the following observations were made:

AS 1530.8.2 13.8 Performance Criteria (shortened to agreed scope)	Time to failure (min)	Position of failure
Sustained flaming for more than 10 s on the non-fire side for the duration of the 120 min test period	No failure	-
Flaming on the fire-exposed face more than 30 min after completion of heating	109	Centre of wall approx. 150mm down from top.
Mean and maximum temperature rises greater than 140 K and 180 K	67 67 68 112	TC11 exceeded max TC12 exceeded max Group3 exceeded ave TC16 NFS upper joint
Mean and maximum temperature of internal faces exceed 250°C and 300°C respectively more than 30 min after completion of heating phase	92	TC1 max and TC1& TC2 ave

5. INTRODUCTION

This report details a test carried out on a timber framed, stud wall with one layer of R2.5 x 90mm thk earthwool and sheeted with a single layer of 10mm thk SE FireCrunch board each side. The test was carried out in general accordance with AS 1530.4-2014 to measure the fire-resistance of the specimen. The specimen under test was installed into steel restraint frame suitable for mounting to the test apparatus.

6. STANDARDS

The measurements leading to the results presented in this report have been undertaken in accordance with standards which specify a method for measuring the fire resistance of building elements:

- AS 1530.4—2014 Methods for fire tests on building materials, components and structures – Part 4: Fire-resistance tests for elements of construction.
- AS 1530.8.2-2007 Part 8.2 Tests on elements of construction for bushfire attack - Large flaming sources
 - Specifically, only C13.8 (b), (c), (e) & (g), reported in accordance with 13.9 and Table 13.3.

The test facility and equipment were in accordance with:

- AS 1530.4—2014 Methods for fire tests on building materials, components and structures – Part 4: Fire-resistance tests for elements of construction.

7. DEVIATIONS FROM THE TEST STANDARD:

Only the general principals of the test Standard were followed as wall testing is required to be carried out at full scale.

Specific variations include edge and end conditions, fixing, and deflection measurements.

During the test the internal furnace pressure fluctuated outside of the control parameters intermittently.

Only the nominated Performance Criteria noted in Section 6 were considered during the cooldown observation phase. This report does not cover any other part of AS 1530.8.2-2007.

8. PERFORMANCE CRITERIA

Criteria of Failure

Under AS 1530.4-2014 the following conditions are set out to describe failure of the element under test with regards to:

Structural Adequacy (loadbearing capacity)

Structural adequacy not evaluated.

Integrity

Failure in relation to integrity shall be deemed to have occurred when evaluated in accordance with Clauses 2.13.2.2 to 2.13.2.4.

The measurement of the integrity of the test specimen shall be made by cotton pad, gap gauge or sustained flaming. For uninsulated assemblies, other than service penetrations, the cotton pad is deemed inappropriate and gap gauges shall be used. The cotton pad is also deemed inappropriate, except for penetration systems, where a fixed or roving thermocouple measures a temperature exceeding 300°C.

Insulation

The measurement of insulation performance is made by thermocouples on the unexposed face compared to the initial temperature.

The specimen shall be deemed to have failed when:

The average temperature on the unexposed face of the test specimen exceeds the initial temperature by more than 140 K; or

The temperature at any location on the unexposed face of the test specimen exceeds the initial temperature by more than 180 K.

Radiation

Radiation not evaluated.

9. CONSTRUCTION DETAILS

Manufacture Information

The test specimen wall was constructed offsite by the Clients contractor GHA Group. It was delivered to Resolute labs on the 14th August. Resolute attached internal thermocouples over the 16th and 17th August and the Client and GHA Group returned on the 20th August to fix off and seal the non-fire side boards.

Supporting Construction

No supporting construction was used in this test as the entire wall comprised of the test specimen.

Test Specimen(s) Description

(Client supplied)

1 X 90 X 45MM SINGLE TIMBER MPG10 STUD FRAME

1 X 10MM FCA SHEET EACH SIDE

INSULATION R2.5 "EARTHWOOL" GLASS WOOL BATT 90MM IN FRAME

AS1530.4 FIRE SEALANT BOSTIK FIRE BAN TO JOINTS AND PERIMETERS

SEALANT IN 3 X 3MM BEADS DOWN EACH (VERTICAL) JOINT 45MM STUD FACE

4MM FIRE GAP BETWEEN VERTICALLY SET BOARDS FILLED WITH SAME FIRE SEALANT

FIXED WITH NEEDLE POINT STAINLESS STEEL SCREWS AT MIN 200 CENTRES. 10 GAUGE x 35mm SELF

EMBEDDING TYPE 17, COUNTERSUNK HEAD, GALV CLASS 3, PHILLIPS DRIVE

10. SUPPORT AND RESTRAINT CONDITIONS

The wall was installed within one of the vertical test specimen frames suitable for mounting to the test apparatus. The wall sat upon a refractory blanket and was compressed against the vertical faces of the test specimen frame, which was fitted with the same refractory blanket, by way of four off compression brackets acting on two vertical angles to spread the compression load evenly across the wall.

11. PRE-TEST CONDITIONING

The specimen was completed on 20/08/18 and left to cure in the indoor laboratory environment for 15 days.

12. DIRECTION OF EXPOSURE

The specimen was subjected to fire exposure from the inside. The wall was symmetrical.

13. SELECTION OF TEST SPECIMEN(S)

The laboratory was not involved in the selection of any specimen materials for this test. The Client supplied and installed all materials for their specimen.

14. TEST PROCEDURE

Furnace Heating Conditions – Temperature Curve

The temperature of the furnace shall be controlled to vary with time, as close as possible, in accordance with the following relationship:

$$T = 345 \log_{10}(8t + 1) + 20$$

Where

T = furnace temperature at time (t), in degrees centigrade

t = time into the test, measured from the ignition of the furnace, in minutes

Laboratory Ambient Temperature at Commencement of fire test

At 10:27 on the 04/09/18 at the commencement of the test, the indoor ambient temperature was 21°C. Over the 120-minute test duration the temperature increased to 22°C.

Furnace Pressure Differential

Furnace pressure was measured with a Dwyer Magnehelic pressure transmitter (S:N 71640), with a probe located 100mm from the face of the test specimen.

Specimen Temperatures

Specimen temperatures measured with type K thermocouples of wire diameter not exceeding 0.5mm, with the measuring junction silver soldered to the face of a 12mm diameter by 0.2mm thick copper disc. Each thermocouple shall be covered with a 30±0.5mm x 30±0.5mm x 2.0±0.5mm thick millboard pad.

Deflection Measurement

Deflection measurement was not taken during this test.

Validation to Variation in Tolerances on the Time/Temperature Curve, Pressure Conditions and/or Ambient Laboratory Conditions

The pressure variations within the furnace chamber are not expected to have detrimentally affected the performance of the test.

15. TEST RESULTS

Performance (whole minutes and FRL)

Specimen : A timber framed, stud wall with one layer of R2.5 x 90mm thk earthwool and sheeted with a single layer of 10mm thk SE FireCrunch board each side

Test Results	
Structural adequacy	n/a
Integrity	62 minutes ¹
Insulation	62 minutes ¹
FRL	-/60/60

¹ No failure recorded.

Post-Test Observation

At the request of the Client a subsequent cooldown and observation phase was carried out after the end of the 60-minute fire test. The Client nominated a modified AS 1530.8.2 Performance Criteria (ref: AS 1530.8.2-2007 C13.8), the modification namely being a 60-minute AS 1530.4 test followed by 60 minutes of observation.

With agreement of the Lab, 13.8 Performance Criteria (as modified above) (b), (c), (e) & (g) were monitored during the observation period.

The test was shut down at 62 minutes and the sample was removed from the furnace without the thermocouples being disconnected from the logging equipment and was placed in a specimen frame cradle. The cradle and wall were positioned on an angle away from the furnace so as to not be affected by radiant heat from the furnace.

Over the subsequent observation period the following observations were made:

AS 1530.8.2 13.8 Performance Criteria (shortened to agreed scope)	Time to failure (min)	Position of failure
Sustained flaming for more than 10 s on the non-fire side for the duration of the 120 min test period	No failure	-
Flaming on the fire-exposed face more than 30 min after completion of heating	109	Centre of wall approx. 150mm down from top.
Mean and maximum temperature rises greater than 140 K and 180 K	67 67 68 112	TC11 exceeded max TC12 exceeded max Group3 exceeded ave TC16 NFS upper joint
Mean and maximum temperature of internal faces exceed 250°C and 300°C respectively more than 30 min after completion of heating phase	92	TC1 max and TC1& TC2 ave

STATEMENTS

THE RESULTS OF THESE FIRE TESTS MAY BE USED TO DIRECTLY ASSESS FIRE HAZARD, BUT IT SHOULD BE RECOGNIZED THAT A SINGLE TEST METHOD WILL NOT PRODUCE A FULL ASSESSMENT OF FIRE HAZARD UNDER ALL FIRE CONDITIONS.

THIS REPORT DETAILS METHODS OF CONSTRUCTION, THE TEST CONDITIONS AND THE RESULTS OBTAINED WHEN THE SPECIFIC ELEMENT OF CONSTRUCTION DESCRIBED HERIN WAS TESTED FOLLOWING THE PROCEDURE OUTLINED IN AS 1530.4. ANY SIGNIFICANT VARIATION WITH RESPECT TO SIZE, CONSTRUCTION DETAILS, LOADS STRESSES, EDGE OR END CONDITIONS, OTHER THAN THAT ALLOWED UNDER THE FIELD OF DIRECT APPLICATION IN THE RELEVANT TEST METHOD, IS NOT COVERED BY THIS REPORT.

BECAUSE OF THE NATURE OF FIRE RESISTANCE TESTING AND THE CONSEQUENT DIFFICULTY IN QUANTIFYING UNCERTAINTY OF MEASUREMENT OF FIRE RESISTANCE TESTING, IT IS NOT POSSIBLE TO PROVIDE A STATED DEGREE OF ACCURACY OF THE RESULT.

Table 10 – Test Observations

TIME		Observations
Min	Sec	
10	0	Slight smoke from edge
15	0	NFS no change
17	0	Cracking heard from sample
20	0	NFS no change
30	0	NFS no change
33	0	No major deflection noticed. Cracking sound continuing intermittently
45	0	NFS no change
50	0	Cracking sounds. NFS no change
55	0	Cracking sounds. NFS no change
60	0	NFS no change
62	0	Furnace burners off. Specimen removed
		Following specimen removal, the specimen was monitored for a further 60 minutes. Observations against failure criteria noted in Section 15 – Post Test Observations.

Appendix C – DRAWINGS

Drawing 1 – Client supplied drawing. Lab added TC locations

Appendix D – PHOTOGRAPHS

Photo 1 – Specimen at start of test

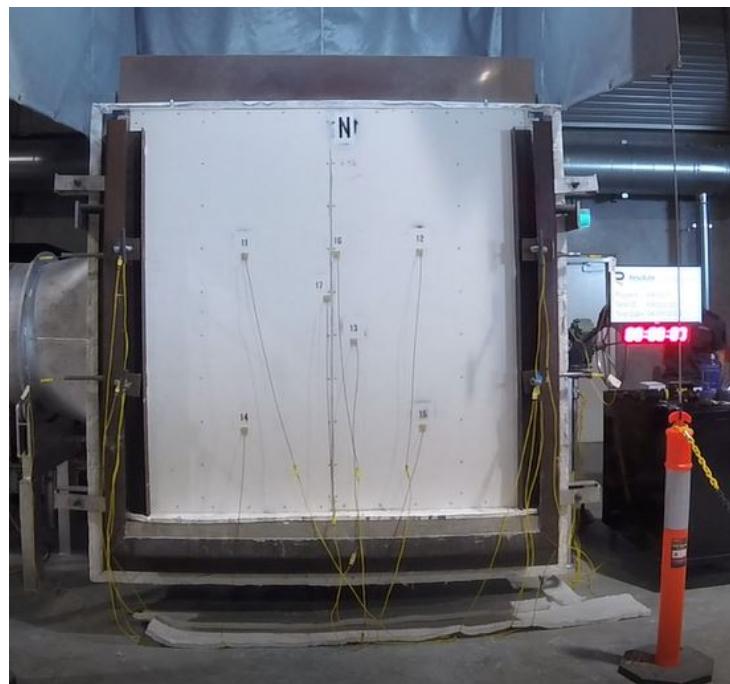

Photo 2 – Specimen at end of 60-minute fire test

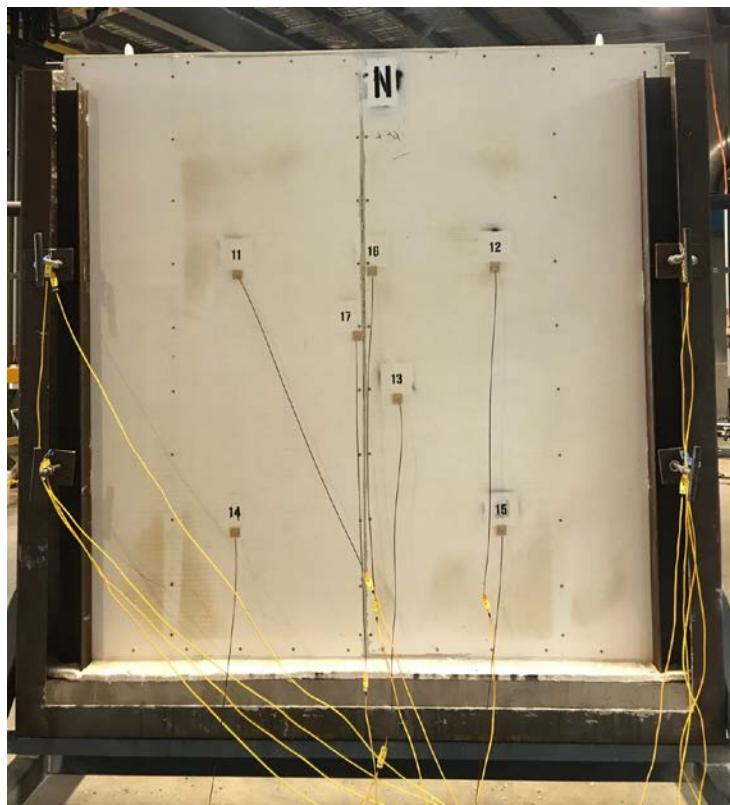

Photo 3 – Specimen at end of 60-minute fire test

Photo 4 – Very start of visible flaming from top gap

Photo 5 – Flaming prior to extinguishment

Photo 6 – Specimen at end of test
